Hydrogels have been widely applied in biomedical applications, such as drug delivery and tissue engineering, due to their many favorable characteristics. Their high water content renders them compatible with living tissues and proteins and their rubbery nature minimizes damage to the surrounding tissue.

Hydrogels for Tissue Engineering Applications | SpringerLink

Tissue engineering is a more recent application of hydrogels, in which they can be applied as space filling agents, as delivery vehicles for bioactive substances or as three-dimensional structures that organize cells and present stimuli to ensure the development of a required tissue . Space filling agents are the most commonly used group of scaffolds and they are employed for bulking, to prevent adhesion, and as a biological ‘ glue ’ .
