This book is a
continuation of my
Biomechanics. The
first volume deals
with the mechanical

Online Library Circulation And

properties of living tissues. The present volume deals with the mechanics

of circulation. A third volume will deal with respiration, fluid balance, locomotion, growth, and strength. This volume is called Bio

dynamics in order

Online Library Circulation And

to distinguish it from the first volume. The same style is followed. My objective is to present the mechanical aspects of physiology in precise terms of mechanics so that the subject can become as lucid as physics. The motivation of

Online Library Circulation And

writing this series of books is, as I have said in the preface to the first volume, to bring biomechanics to students of bioengineering, physiology, medicine, and mechanics. I have long felt a need for a set of books that will inform the

Online Library Circulation And

students of the
physiological and
medical applica
tions

of biomechanics, and
at the same time
develop their
training in mechan
ics. In writing these
books I have
assumed that the
reader already has
some basic training
in mechanics, to a

Online Library Circulation And

level about
equivalent to the
first seven chapters
of my First Course
in Continuum
Mechanics
(Prentice Hall,
1977). The subject
is then presented
from the point of
view of life science
while mechanics is
developed through a
sequence of

Online Library Circulation And

problems and examples. The main text reads like physiology, while the exercises are planned like a mechanics textbook. The instructor may fill a dual role :teaching an essential branch of life science, and gradually developing the

Online Library
