These diseases include Liddle's syndrome, long QT syndrome, hyperkalemic periodic paralysis, cystic fibrosis, myotonia congenita, nephrogenic diabetes insipidus, glucose/galactose malabsorption, cystinuria, and Wilson's disease. Gene mutations in several receptors, including vasopressin V2 receptor, dihydropyridine receptor, and Ca2+ -sensing receptor, also cause disorders of membrane transport, leading to diseases.

The field of pharmacology is greatly beholden to the study of disorders of membrane transport, which helped to shape the design of drugs such as calcium channel blockers, proton pump inhibitors, and receptor-blocking agents. Also, the increased understanding of the biochemical composition and topology of cell membranes deriving from studies of these diseases greatly informed investigations of acquired immune-deficiency syndrome, as well as the development of antibiotic and antiviral agents.

XA The red cell membrane disorders include alterations in both membrane structural organization and membrane transport function. The membrane structural organization disorders are hereditary spherocytosis, hereditary elliptocytosis, and hereditary ovalocytosis; the primary membrane transport function disorder is hereditary stomatocytosis.

Molecular Biology of Membrane Transport Disorders Book Description : When the six of us gathered to start planning for what was to be the Third Edition of Physiology of Membrane Disorders, it was clear that since 1986, when the Second Edition appeared, the field had experienced the dawning of a new era dominated by a change in focus from phenomenology to underlying mechanisms propelled by the ...

Hyaline Membrane Disease. Alzheimer's Disease. Cystic Fibrosis. Duchenne Muscular Dystrophy. Written by Stephen Pomposello. 27 July, 2017. Cell membrane diseases are life-threatening disorders that are genetic in nature, and they usually work against proteins in our body that are key to ion channels and various receptors within the membrane.

Significant advances have been made in our understanding of the structural basis for altered cell function in various inherited red cell membrane disorders with reduced red cell survival and resulting hemolytic anemia. The current review summarizes these advances as they relate to defining the molecular and structural basis for disorders involving altered membrane structural organization (hereditary spherocytosis [HS] and hereditary elliptocytosis [HE]) and altered membrane transport ...

Inherited defects in amino acid transport at the cell membrane ( Fig. 139-1 and Table 139-1) are expressed as selective renal aminoaciduria (ie, the concentration of the affected amino acids is high in the urine while it is normal or low in plasma). Intestinal absorption of these amino acids is almost always impaired.

Measurements made in the blood, part of the extracellular compartment, are used in the clinical assessment of acid-base disorders; however, intracellular events determine much of the metabolic importance of these disorders. Intracellular and interstitial compartment acid-base balance is complex and varies in different tissues.

From an equally small number of such patients some fundamental characteristics of membrane transport of amino acids in the human kidney have also been discerned, and the majority of this discussion will be directed to this topic. The initial identification of "aminoacidopathies" requires only simple screening of plasma or urine.
