According to COCOMO Complexity, the software effort is calculated based on predetermined coefficients based on complexity and, lines of code, for example, if we considered that we are using organic project type our calculation will be as follow: Effort Applied (E)= $a \cdot (KLOC)^b = 3.2 \cdot (10)^{1.05} \approx 35$ Person Months

5 Steps to Software Development Effort Estimation ...

In software development, effort estimation is the process of predicting the most realistic amount of effort required to develop or maintain software based on incomplete, uncertain and noisy input. Effort estimates may be used as input to project plans, iteration plans, budgets, investment analyses, pricing processes and bidding rounds.

Presales teams need effort estimation in order to cost price custom software and project managers need it in order to allocate resources and time plan a project. Usually, software development is priced based on the person days, it requires in order to be built, multiplied by a daily person day rate.

Without effort estimation pricing is impossible.

The four basic steps in software project estimation are: 1) Estimate the size of the development product. This generally ends up in either Lines of Code (LOC) or Function Points (FP), but there are other possible units of measure. A discussion of the pros & cons of each is discussed in some of the material referenced at the end of this report.
