A dielectric is an electrical insulator that can be polarized by an applied electric field.

When a dielectric material is placed in an electric field, electric charges do not flow through the material as they do in an electrical conductor but only slightly shift from their average equilibrium positions causing

dielectric polarization.

Because of dielectric polarization, positive charges are displaced in the direction of the field and negative charges shift in the direction opposite to the field.

and breakdown of dielectrics under electric field. Then, two of electric field-related applications, dielectrics for electrical energy storage and electrocaloric (EC) effect for refrigeration are discussed. Conclusion and perspectives are given at last.
