Example of Rectangular Wave. As an example, let us find the exponential series for the following rectangular wave, given by.  $f(t) = 4, = - 4, f(t + 2) = f(t) 0 < t < 1 1 < t < 2$ . With  $T=2$ . We have  $\omega = 2\pi/T = \pi$ , and thus by (4)  $c_n = \frac{1}{T} \int_0^T f(t)e^{-jn\omega t} dt$ . For  $n \neq 0$  this is.

The function  $\sin(x/2)$  twice as slow as  $\sin(x)$  (i.e., each oscillation is twice as wide). In the same way

$T(t/2)$  is twice as wide (i.e., slow) as  $T(t)$ . The Fourier Series representation is.  $x_T(t) = a_0 + \sum_{n=1}^{\infty} (a_n \cos(n\omega_0 t) + b_n \sin(n\omega_0 t))$

From Trigonometric Fourier Series, if there is half-wave symmetry, all even harmonics are zero, thus both  $a_n$  and  $b_n$  are zero for even. Hence  $a_n$  and  $b_n$  are also zero when  $n$  is even. No symmetry If there is no symmetry the Exponential Fourier Series of  $f(t)$  is complex. Relation of  $C$  to  $C$  always  $C_{-k} = C_k^*$   $C_k = (C_{-k})^*$   $C_k = C_k^*$   $C_{-k} = C_k$

I will go immediately to the most important example of a Fourier sine series.  $S(x)$  is an odd square wave with  $SW(x)=1$  for  $0 < x < \pi$ . It is drawn in Figure 4.1 as an odd function (with period  $2\pi$ ) that vanishes at  $x=0$  and  $x=\pi$ .  $SW(x)=1 - 0$   $2\pi$  Figure 4.1: The odd square wave with  $SW(x+2\pi)=SW(x)=\{1 \text{ or } 0 \text{ or } -1\}$ .

Site Map The Exponential Fourier Series uses, instead of the bases of the sines and cosines of the Trigonometric Fourier Series, an equivalent bases of exponential functions. This bases may look like where, as before,  $\omega_0$  is the base frequency of the signal and  $j = \sqrt{-1}$  (often seen elsewhere as  $i$ )

Exponential Fourier Series Spectra The exponential Fourier series spectra of a periodic signal ( ) are the plots of the magnitude and angle of the complex Fourier series coefficients. Let ( ) be a real, periodic signal (with frequency  $\omega_0$ ).

The Exponential Form Fourier Series

Fourier series is almost always used in harmonic analysis of a waveform. Fourier series is applicable to periodic signals only. Using fourier series, a periodic signal can be expressed as a sum of a dc signal, sine

Fourier series - Wikipedia

Assuming for the moment that the complex Fourier series "works," we can find a signal's complex Fourier coefficients, its spectrum, by exploiting the orthogonality properties of harmonically related complex exponentials. Simply multiply each side of the Fourier Series equation by  $e^{-i2\pi lt}$  and integrate over the interval  $[0, T]$ .
