Pierre Lascombes and the Nancy University Orthopedic Faculty are synonymous with the concepts, principles, and practice of fracture care using flexible intramedullary nailing (FIN), also known as elastic stable intramedullary nailing (ESIN). Thus, the publication of this book in English (a translation from Professor Lascombes' 2006 publication in French) has been long awaited, and proves to be an outstanding and invaluable contribution to the orthopedic literature.

Pierre Lascombes: Flexible intramedullary nailing in ...

Over the past three decades, the flexible intramedullary nailing (FIN) technique that originated in the University of Nancy in France has evolved to the point where it is becoming the gold standard for the treatment of many fractures in children.

Flexible Intramedullary Nailing in Children: The Nancy ...

Abstract. Elastic stable intramedullary nailing (ESIN) has become a well-accepted method of osteosynthesis of diaphyseal fractures in children and adolescents for many reasons including the following: no need for postoperative cast, primary bone union with avoidance of growth plate injury, and minimum invasive surgery.

Use and abuse of flexible intramedullary nailing in ...

The present study assesses the radiological and functional outcomes of treating displaced forearm fractures in children with intramedullary flexible titanium elastic nailing. Methods A total of 31 patients aged between 7 and 15 years old with displaced forearm fractures underwent flexible titanium elastic nailing. The patients were followed-up for a mean period of 8.51 months (range: 6–12 months) and were assessed for radiological and functional outcomes.

Intramedullary Flexible Nailing for Diaphyseal Fractures ...

Flexible intramedullary nailing is an effective and safe procedure for the treatment of unicameral cysts in the humerus and femur. Facile aftercare, low morbidity and effective prevention of refracturing make it the treatment of choice for this kind of lesion in our service in a so-called developing country.

Flexible intramedullary nailing for unicameral cysts in ...

Flexible intramedullary nailing has emerged as an accepted procedure for paediatric femoral fractures. Present indications include all patients with femoral shaft fractures and open physis. Despite its excellent reported results, orthopaedic surgeons remain divided in opinion regarding its usefulness and the best material used for nails.

Flexible intramedullary nailing in paediatric femoral ...

Most proximal and diaphyseal pediatric humeral fractures can be treated successfully by closed means; however, certain patient factors or fracture characteristics may make surgical stabilization with flexible intramedullary nails (FIN) a better choice.

Flexible Intramedullary Nailing of Pediatric Humeral ...

Flexible nails are excellent implants combining stability and elasticity. The procedure of passing the nails across radius and ulna is relatively simple, requiring a small learning curve. Flexible intramedullary nailing is an excellent treatment modality for the treatment of forearm fractures in children and adolescents.

Flexible intramedullary nailing in the treatment of ...

Flexible intramedullary nailing is an excellent option, with many advantages over plating, including smaller incisions, improved cosmesis, less tissue disruption, shorter operative and tourniquet time and increased ease in hardware removal. 7, 17 However, plating is associated with a more anatomical restoration of the radial bow and a more rigid fixation which requires minimal postoperative ...

Flexible intramedullary nailing in the treatment of ...

We evaluated use of flexible intramedullary nails in the surgical treatment of femoral shaft fractures in 135 children (138 fractures). Mean age was 9.7 years (range, 2-17 years). Mean follow-up was 15.6 months (range, 6.6-53.5 months). Seventy-two patients were treated with stainless-steel (Ender) nails and 66 with titanium elastic nails.

Use of flexible intramedullary nail fixation in treating ...

Children from 6 years of age to skeletal maturity are treated with flexible intramedullary nails, generally inserted in the antegrade fashion described above. In the teenaged patient, Ender's nails are used, and in the 6- to 10-year age group, flexible 3 or 4 mm flexible nails are used.

Flexible Intramedullary Nail Fixation of Pediatric Femoral ...

Flexible intramedullary nailing in children: nail to medullary canal diameters optimal ratio. Lascombes P(1), Huber H, Fay R, Popkov D, Haumont T, Journeau P. Author information: (1)Division of Paediatrics Orthopaedic, University of Geneva, Geneva, Switzerland. pierre.lascombes@hcuge.fr
