Population and Resources. This topic expands the discussion to the role of resources (land, energy) and population growth. It explores under what conditions economic growth is limited by available resources and when resource limits are not binding. This depends in part on the speed of population growth, which adapts to economic conditions as well, helping to determine the effect of resource use.

The y-axis measures growth rates, and the x-axis is the level of GDP per capita. The green horizontal line plots the term involving \$g\_{AS}\$ (along with the \$alpha\$ and \$beta\$ stuff). The red line plots the relationship of the population growth rate and GDP per capita (again including all the \$alpha\$ and \$beta\$ stuff and setting \$theta=1\$).

To understand this we'll build out the Solow model which involves capital accumulation, population growth, productivity growth. The idea that capital has a diminishing marginal product is going to generate dynamics that ensure economies end up on a balanced growth path, with all the stability we see in the data.

**Introduction—Growth Study Guide**

Boom-and-Bust cycles occur when the population growth of one species is closely tied to a limiting factor that may be expended. The predator populations increase and decrease as the prey numbers change. Predation may be an important cause of density-dependent mortality for some prey. Boom-and-bust cycles: Prey populations rapidly increase.

Population growth is large (e.g. lots of food, low mortality) and productivity growth cannot keep up. So GDP per capita falls and pushes GDP per capita to the left. Regardless, what the Malthusian setting exhibits is stability. The dynamics work such that GDP per capita is always getting pushed towards the point where the red and green lines intersect.

**Malthusian Demographics—Growth Study Guide**

population growth rate is the increase in a country's population during a period of time, usually one year, expressed as a percentage of the population at the start of that period. It reflects the number of births and deaths during a period and the number of people migrating to and from a country. total fertility rate (TFR)

What about the growth rate of GDP per capita over time? At first, in economy A this is  $\frac{g_y}{y}A = \frac{1}{3}[1-3] \cdot 224 + .02 = .116$ , or 11.6%. But over time, as the growth rate of the capital/output ratio falls in A, so will the growth rate of GDP per capita. In B, the initial growth rate of GDP per capita is

Population Growth. To understand and appreciate ecology at the community and ecosystem levels, you must first have a good grasp on ecology at the population level, often called population ecology. Population ecology is the level of ecology that focuses on characteristics of whole populations rather than attributes of individual organisms. In fact, most of the aspects of populations that ecologists look at cannot even be measured using individual organisms.
