The Eysenck Personality Inventory (E.P.I.) is a development of The Maudsley Personality Inventory (M.P.I.-Eysenck, 1959a; Knapp, Ig62). Like the parent instrument, it sets out to measure two major dimensions of personality, extraversion and neuroticism. It is sufficiently similar to the M.P.I., and correlates sufficiently

Hans Eysenck. In psychology, Eysenck Personality Questionnaire (EPQ) is a questionnaire to assess the personality traits of a person. It was devised by the psychologists Hans Jürgen Eysenck and his wife Sybil B. G. Eysenck. Hans Eysenck's theory is based primarily on physiology and genetics. Although he was a behaviorist who considered learned habits of great importance, he considers personality differences as growing out of our genetic inheritance. He is, therefore, primarily interested in ...

<b>Hans Eysenck – Wikipedia</b>
Studies examining Eysenck's theory of criminality by contrasting delinquent and non-delinquent groups have produced equivocal results. Some studies have shown criminals to score higher, as the theory predicts, on psychoticism, neuroticism and extraversion, whilst other studies have not. The current study examines the theory from a new approach by using cluster analysis to demonstrate the heterogeneity of personality types in delinquent sample ( N =100) and in a comparison group ( N = 100).
