Since 1958 the Association for the Study of Internal Fixation (ASIF) has worked to establish the experimental and biomechanical principles of the operative treatment of fractures. It has been proven that immediate, pain-free mobilization, made possible by stable internal fixation, is the key to restoring function in a fractured extremity. The same principles were applied in 1972¹⁷³ by Roland Schmoker, who developed a universal plate and sophisticated instrument set designed initially for the treatment of comminuted fractures of the mandible. To extend the applications of his plate to reconstructions after extensive tumor resections, he supplemented the device with temporomandibular joint prostheses and anchoring elements for the attachment of dentures. He first tested the functional stability of these implants experimentally in sheep. Later he found that the minipig had a more human-like jaw shape and masticatory action, and so he tested the implants in 37 mini pigs that underwent extensive mandibular resections without bone grafting, using sequential dye injections and postoperative weight gain to chart the progress of osseous regeneration. Seven other animals were not operated and served as controls.

The idea behind this book is to produce a fully comprehensive and highly illustrated "how to" technical reference manual, demonstrating surgical procedures in a step by step manner. This book also covers assessment and investigations, but focuses on the surgical and non surgical management of all aspect of maxillofacial trauma. It will include most, if not all, of the surgical approaches and techniques used, for all injuries. This volume includes emergency procedures and the various techniques in repair of fractures and soft tissue injuries, from the simple to the complex. Each step is illustrated photographically or with line diagrams, with explanatory text. This will enable surgical trainees and surgeons with limited trauma experience to understand how and why any particular procedure is undertaken.
