Future occupational burden predictions from the British study demonstrate that the legacy of higher exposures in the past will continue to influence attributable cancer numbers for the next 20–30 years . Comparison of forecasts from different scenarios for changes in exposure, such as gradual reduction, complete elimination or stepped reduction in levels through lowering of occupational limits will facilitate the policy choices for legislators and employers.

OCCUPATIONAL CANCER. Around the world, 12.7 million people are diagnosed with cancer every year, and the number is expected to increase due to the growth and aging of the population, as well as reductions in childhood mortality and deaths from infectious diseases in developing countries (1). Cancer is the leading cause of death in developed countries and the second leading cause of death in developing countries.
