“ SPONTANEOUS ” Nuclear Decay, The Half-Life? Radioactive Decay And Half Life  
The radioactive decay of a certain substance is measured by a special term known as the half life. The time taken by a substance to become half of its initial mass through radioactive decay is measured as the half life of that substance. This is the relationship between radioactive decay and half life.

During natural radioactive decay, not all atoms of an element are instantaneously changed to ...

### 2.5: Natural Radioactivity and Half-Life - Chemistry ...

The decay of radioactive elements occurs at a fixed rate. The half-life of a radioisotope is the time required for one half of the amount of unstable material to degrade into a more stable material. For example, a source will have an intensity of 100% when new. At one half-life, its intensity will be cut to 50% of the original intensity.

## Radioactive Decay And Half

One of the most useful terms for estimating how quickly a nuclide will decay is the radioactive half-life ( $t_{1/2}$ ). The half-life is defined as the amount of time it takes for a given isotope to lose half of its radioactivity. As was written, radioactive decay is a random process at the level of single atoms, in that, according to quantum theory, it is impossible to predict when a particular ...

What is Radioactive Half-Life - Physical Half-Life ...

Half-Life, Decay Constant, and Mean Lifetime Radioactive decay is an exponential process, meaning that the quantity of matter decreases at a rate proportional to its current value. The most intuitive mathematical description of the rate of decay is half-life, which our half-life calculator can calculate.

## Radioactive Decay And Half

Those that decay are called radioactive (or parent) isotopes; those that are generated by decay are called radiogenic (or daughter) isotopes. The unit that we use to measure time is called half-life and it has to do with the time it takes for half of the radioactive isotopes to decay (see below). Half-life: a useful way of telling geologic time

Radioactive Decay - [serc.carleton.edu](http://serc.carleton.edu)

It ' s important to realize that the half-life decay of radioactive isotopes is not linear. For example, you can ' t find the remaining amount of an isotope as 7.5 half-lives by finding the midpoint between 7 and 8 half-lives. This decay is an example of an exponential decay, shown in the figure below. Decay of a radioactive isotope.

A sample of radioactive material has a half life of 30 ...

Half-life, in radioactivity, the interval of time required for one-half of the atomic nuclei of a radioactive sample to decay (change spontaneously into other nuclear species by emitting particles and energy), or, equivalently, the time interval required for the number of disintegrations per second of a radioactive material to decrease by one-half. Decay graphs and half lives article (article) |  
Khan Academy

Radioactive carbon (C-14) has a half-life of 5730 years. In spite of this rather "short" half-life compared to the age of the earth, C-14 is a naturally occurring isotope! The reason for this is that C-14 is formed continuously in the atmosphere when neutrons (originating from the cosmic radiation) interact with nitrogen atoms.
