In this monograph the narrow topology on random probability measures on Polish spaces is investigated in a thorough and comprehensive way. As a special feature, no additional assumptions on the probability space in the background, such as completeness or a countable generated algebra, are made. One of the main results is a direct proof of the random analog of the Prohorov theorem, which is obtained without invoking an embedding of the Polish space into a compact space.

the set of Borel probability measures over a Polish topological space (V, τ) ; re-call that the space is Polish if τ is a metrizable topology under which V is complete and separable [1, 17]. Let P_n is probability measure in (S, \mathcal{S}) (S is polish space). Then P_n is tight iff there exist random variable $X: S \rightarrow [0, 1]$ such that. (1) $\{X \geq c\}$ is compact for all $0 < c < 1$. (2) $P_n(X = 0) = 0$. (3) $\sup_n E_n X < 1$.
