Introduction. In this book we delve into the field of supramolecular chemistry, which deals with supermolecules. A supermolecule in this sense can be defined as a "molecule beyond a molecule" – a large and complex entity formed from other molecules. The book conveys the relevance and fascination of the fast-growing field of supramolecular chemistry to advanced undergraduate students, and provides an overview of it to young scientists and engineers.

Important concepts that have been demonstrated by supramolecular chemistry include molecular self-assembly, folding, molecular recognition, host-guest chemistry, mechanically-interlocked molecular architectures, and dynamic covalent chemistry. The importance of supramolecular chemistry was established by the 1987 Nobel Prize for Chemistry, which was awarded to Donald J. Cram, Jean-Marie Lehn, and Charles J. Pedersen in recognition of their work in the field.
