Gene Expression and Operon Systems Operons: In genetics, an operon is a functioning unit of genomic DNA containing a cluster of genes under the control of a single promoter. The genes are transcribed together into an mRNA strand and either translated together in the cytoplasm, or undergo trans-splicing to create monocistronic mRNAs that are translated separately, i.e. several strands of mRNA ...

of day. Expression variation was calculated for each gene by a log ratio between the expression values. Within-pair variation was given by averaging the three ratios for the three pairs: $P_{ij} = \frac{1}{3} \log \frac{E_{i1}}{E_{i2}}$, where i_1 and i_2 indicate the expression values for the two individuals of i th twin pair.
